2. INTRODUCTION

The UK Acid Waters Monitoring Network (UKAWMN) has been operating continuously since 1988. This report presents summary data for the full suite of measurements at all original sites up until June 2007, and for the reduced numbers of measurements and sites that continued to be funded up until April 2012.

During the first ten years of monitoring biological and chemical data were summarised in an annual series of printed reports. Since the year 2000 annual data reports have also been available from the [UKAWMN](#) web page. These are of a similar format to earlier annual reports but focus on graphical representations of time trends in raw data and diagnostic statistics (e.g. species richness and diversity indices). Detailed analysis of data has been presented in five interpretative reports, Kernan *et al.* (2010), Monteith and Shilland (2007), Monteith (2005), Monteith and Evans (2000) and Patrick *et al.* (1995), dealing with 20, 18, 15, 10 and 5 years of accumulated results respectively. All but the oldest can be found in the reports section of the [UKAWMN](#) web site. A full description of sampling methods and analytical procedures, together with site descriptions, is also presented on the UKAWMN web page.

3. THE MONITORING NETWORK

The UKAWMN was originally established by the UK Department of Environment (now Defra) in 1988 following the recommendations of the UK Acid Waters Review Group (AWRG, 1987) in order to assess the chemical and biological response of acidified lakes and streams in the UK to planned reduction in emissions.

The UKAWMN sites are all located in relatively acid-sensitive regions, in upland areas with catchments underlain by base-poor soils and geology (Figure 3.1., Table 3.1.). Although monitoring has been underway at most sites continuously since 1988, sampling at certain sites began later and there have also been a small number of interruptions in the record when sampling was not possible (Table 3.2.). The Network originally comprised 10 stream and 10 lakes sites. In 1990 two sites in Northern Ireland were added (Blue Lough and Coneyglen Burn), supported by funding from the Department of Environment (Northern Ireland). At the start of 1991 the Nant y Gronwen (site 18) was removed from the Network following a request from the landowner and was replaced by a nearby moorland stream, Afon Gwy. More recently, as a result of water abstraction and damming by a local fish farm at Coire nan Arr (Site 1) a new 'control' site was added to the Network, Loch Coire Fionnaraich (Site 23).

Between 1988-2004 data collection and analyses at 20 of the UKAWMN sites were funded by Air Quality Division at Defra (previously Department of the Environment), with two sites in Northern Ireland being funded by the Department of Environment (Northern Ireland) (DoE(NI)). The Scottish Executive (SE) and subsequently Scottish Government (SG) contributed 50% of the funding for AWMN work by the Scottish

Government's Marine Scotland Freshwater Laboratory (MS). In 2001 DoE(NI) withdrew from directly funding the Programme and Defra took up funding of the Network in Northern Ireland.

Following a funding hiatus at Defra in mid-2007, chemical sampling and analyses at several sites were halted and, more widely, fish surveys and lake macrophyte surveys were cancelled for that year.

The reduced Network of sites and analyses that remained after reductions in central funding has been sustained only as a result of significant contributions in kind from the NERC Centre for Ecology and Hydrology (CEH), Marine Scotland and ENSIS-ECRC at UCL; financial assistance from the Welsh Government, Countryside Council for Wales (CCW), the Environment Agency (EA), Scottish Natural Heritage (SNH) and the Forestry Commission (FC); and assistance from the School of Biological Sciences, Queen Mary University of London (QMUL) and several private individuals. The impact of the funding cuts has thereby been partly mitigated and consequently the monitoring programme that was in place between 1988-2007 has been maintained as far as possible at most sites in the period since 2007 (Table 3.2.).

All sites have been monitored chemically and biologically according to methodologies described on the methods section of the [UKAWMN](#) web site. Water samples are collected monthly at stream sites and quarterly at lake sites. Epilithic diatoms and benthic invertebrates are sampled annually. Aquatic macrophytes are surveyed between June and September, annually at stream sites and biannually at lake sites. Stream sites and the outflow streams of lake sites are electro-fished annually in the autumn.

In addition to the annual surveys, sediment cores were taken from all lake sites during the first five years of monitoring. These were radiometrically dated and analysed for diatoms, carbonaceous particles (derived from the combustion of fossil fuels) (Rose *et al.* 1995) and trace metals. Results of this work are presented in Patrick *et al.* (1995) and Juggins *et al.* (1996). Sediment traps installed in all lakes are emptied annually. The contents are analysed for diatom species composition, trace metals and the flux of carbonaceous particles, allowing direct comparisons to be made with the historical (sediment core) record. Temperature data from thermistors attached to the sediment traps is downloaded at the same time.

All chemical, physical and biological data are stored in a database managed by CEH, ENSIS and MS. Summary data are available to scientific and other interested organisations on request. Further information on the UKAWMN, including site descriptions and photographs, is available via the internet at the address:

4. DATA FORMAT

The chemical and biological data are presented in a series of sections, summarised below, on a site-by-site basis.

Section 1:	<p>Time series graphs of key spot sampled chemical determinands for individual samples.</p> <p>Summary table for key chemical determinands including: the mean over the 1988-1993 baseline period; the mean for the current year (2011-2012) and the standard deviation for the current year. The normal number of observations per year is 4 for lakes and 12 for streams.</p>
Section 2:	<p>Macroinvertebrates. Time series of macroinvertebrate taxon % abundance in annual aggregated samples (5 kick samples from lake littoral habitats or from riffle areas in streams), and annual total number of individual animals. Some species occurring at less than 1% relative abundance are omitted.</p> <p>Macroinvertebrate summary statistic time series:</p> <ol style="list-style-type: none"> 1) total number of individuals; 2) number of individuals identified at Genus level only (excludes some ubiquitous groups such as the chironomids and oligochaetes); 3) total number of taxa; 4) Diversity Indices: <ul style="list-style-type: none"> a) Hill's N_1, the exponent of Shannon's Index and a measure of the number of abundant species in a sample (Hill, 1973). b) Hill's N_2, the reciprocal of Simpson's Index and a measure of the number of very abundant species in a sample (Hill, 1973). c) E_5, a measure of evenness based on the ratio $(N_2-1):(N_1-1)$. As a single species becomes more and more dominant, E_5 tends to zero.
Section 3:	<p>Salmonids. Summary density diagrams of trout and salmon, if present, in three 50m reaches (number of individuals caught per m^2 survey area) for each year of the monitoring period. ($0+$ = new recruits, "fry", $>0+$ = all fish over one year of age prior to going to sea, "parr"). The bottom reach is coloured blue, middle reach pink and top reach green.</p>
Section 4:	<p>Epilithic diatoms. Time series of annual mean percentage frequency (from 3-4 replicate samples) of taxa occurring at greater than 2 % abundance in any one sample.</p> <p>Epilithic diatom summary statistic time series. Mean, maximum and minimum for:</p> <ol style="list-style-type: none"> a) Hill's N_1 (see above) b) Hill's N_2 (see above) c) E_5 (see above) d) Diatom inferred pH (Di pH), reconstructed from the diatom data using C2 (Juggins, 2007) running the Weighted Averaging Partial Least Squares method and using pH training set data from the SWAP project (Stevenson et al. 1991). Bootstrapping was performed to choose the best Component to use for the reconstruction. Component 2 improved

	<p>the model prediction by over 5% and was therefore chosen, and is shown here alongside the diatom percentage abundance stratigraphy. pH reconstructions are intended only for application to sedimentary diatoms but directional trends in inferred pH of epilithic assemblages should provide an indication of the direction of a response to changing acidity.</p>
Section 5:	<p>Aquatic macrophytes. For lakes relative species abundance determined on a five point scale (comparable to the DAFOR scoring system, Palmer <i>et al.</i> 1992) following shoreline survey, shore transects and deep water grapnel trawls, as follows:</p> <ol style="list-style-type: none"> 1. rare/infrequent 2. occasional but not abundant 3. widespread but not abundant 4. locally abundant 5. widespread and abundant <p>For streams, total macrophyte cover estimated for 5m sections of a 50m survey stretch and each then partitioned into proportional species abundance to provide percentage cover for each species. Data analysed for this report are the mean species cover estimates for the 50m stretches.</p>
Section 6:	For lake sites only. Histogram of diatom species composition from annually retrieved sediment traps. Species occurring at less than 1% abundance in all years are omitted.
Section 7:	For lake sites only. Time series graphs of annual data from thermistors attached to the sediment traps. Thermistor pairs are used, one 1.5m from the lake bottom and the other 1m from the water surface.
Section 8:	Lochnagar only. Time series graphs of annual data from the weather station situated next to the loch. Wind speed, air pressure, air temperature, energy and relative humidity are presented.
Section 8:	Llyn Llagi only. Time series depth-temperature contour plot of data from a thermistor chain suspended near the deepest part of the site. Thermistors are located at 50 cm intervals to 2m water depth and at 1m intervals thereafter.
Section 9:	Llyn Llagi only. Time series graphs of annual data recorded by In-Situ logger devices. One device is situated in the lake and records water temperature and stage height. Another device is positioned in the lake outflow and records temperature, stage height and conductivity.

After the site by site data a final section presents sediment trap Mercury, Lead and Spheroidal Carbonaceous Particle concentrations for all the lake sites.
